HotRock begins new geothermal project

Drilling for hot water has again commenced in the Upper Rhine Graben. HotRock Holding, Karlsruhe gave the go-ahead for the beginning of deep drilling works in Insheim today. Adjacent to the autobahn A 65, a new geothermal power plant with two deep drillings of more than 3000 m will be constructed. The general contractor Bestec, Kandel and the drilling company Jaslo Polska already both contributed to the successful completion of the geothermal power plant in Landau.

HotRock Engineering, together with Marsh, has created an insurance concept which for the first time also covers the finding risk. Insheim is the first project in the Upper Rhine Graben to be carried out with this comprehensive insurance. All players are convinced that the drilling will be successful and that hot water will be found soon in Insheim.

With the Insheim project, HotRock again demonstrates its leading role in the development of deep geothermics in the Upper Rhine Graben. This hottest area of Germany offers a huge potential for the future. Other projects by HotRock Holding are already in planning and shortly before implementation.
